Session: Shortest Path Algorithm
(All Pair Shortest Path)

All Pair Shortest Path Problem [Floyd-Warshall Algorithm]

Instance of an algorithmic paradigm called dynamic programming

1. Given: A directed weighted graph $G(V, E)$, for each edge $(v_1, v_2) \in E$ and an associated weight of an edge $w(v_1, v_2)$
2. Find: A shortest path from v_1 to v_2 for every pair of vertices v_1 and v_2 in V

if $d^{(k-1)}[v_i, v_k]$ is shortest path from v_i to v_k using nodes $(1, \dots, k-1)$
" " " " v_k to v_2 using nodes $(1, \dots, k-1)$
" " " $d^{(k-1)}[v_k, v_2]$ " " "
$$d^{(k)}[v_i, v_2] = \min(d^{(k-1)}[v_i, v_k] + d^{(k-1)}[v_k, v_2], w(v_i, v_2))$$

Floyd-Warshall Algorithm: Setting up Notation

1. Given a directed weighted graph $G(V, E)$, the weight of each edge $(v_1, v_2) \in E$ can be defined using an adjacency-matrix representation W
2. If W is an $n \times n$ matrix,

$$w[i,j] = w_{v_i v_j} = \begin{cases} 0 & \text{if } i = j, \\ \text{weight of directed edge } (v_i, v_j) & \text{if } i \neq j \text{ and } (i, j) \in E, \\ \infty & \text{if } i \neq j \text{ OR } (i, j) \notin E. \end{cases}$$

3. Distance matrix $D^0 = W \rightarrow$ shortest path matrix for all pairs with path through \emptyset (empty set)
4. Predecessor matrix L can be defined as

Book keeping for shortest path

$$L^0(i, j) = \begin{cases} i & \text{if } (i, j) \in E \\ \text{NULL} & \text{if } i = j \text{ and } (i, j) \notin E. \end{cases}$$
